

Attachment to Amendment dated October 11, 2002

Abstract of the Disclosure

B5
A device for administering a composition in a wall of a duct of a human or animal body includes a radially expandible member configured to enter a duct. Cutting elements project from an outer surface of the expandible member for making blind openings in the wall with the member in an expanded state. A composition-dispensing component includes a cuff which is slidable axially over the radially expandible member after the blind openings have been made and the radially expandible member has returned to a retracted state. Then, the member can be re-expanded to expand the cuff.
